

Envision of the web application:

My web application will be a social blogging site for students including:

- Authentication
- Write/edit/read articles
- Ability to "favorite" articles
- Ability to follow other users & have their articles show up in "your feed"

Intended target user group:

Students who want to write articles about life and study at the university, as well as read posts by other students, "favorite" the articles they like, and follow the authors they like. Also, for people considering this university to study in the future.

Value to the user:

The student can find the information of interest, to be aware of what's going on in student's life, to see what topics students care about.

High-level architecture diagram annotated with choice of software technologies to be used for front-end and backend shown below:
